

Download Ecosystem Based Management For The Oceans

Fisheries management is the activity of protecting fishery resources so sustainable exploitation is possible, drawing on fisheries science, and including the precautionary principle. Marine ecosystems are the largest of Earth's aquatic ecosystems and are distinguished by waters that have a high salt content. These systems contrast with freshwater ecosystems, which have a lower salt content. Nature-based Solutions (NbS) are defined by IUCN as “actions to protect, sustainably manage, and restore natural or modified ecosystems, that address societal challenges effectively and adaptively, simultaneously providing human well-being and biodiversity benefits”.- iii - PREPARATION OF THIS DOCUMENT This desk review of relevant aspects of an ecosystem approach to fisheries (EAF) was specifically prepared to facilitate the work of the FAO Technical Consultation on the Ecosystem-based, Ecosystem Based Management For The Oceans.
